

QuantumBerry AI

APPLIED AI ENGINEERING STUDIO · CAPE TOWN, SOUTH AFRICA

PARTNER INTRODUCTION

Automate Everything. Engineer the Future.

One studio, one system. Autonomous AI agents, AI-powered websites and operational interfaces, AI audits and AI cybersecurity, built end to end for South African business.

Partner Introduction

INTELLIGENT SYSTEMS.

REAL WORLD IMPACT.

CHAD@QUANTUMBERRYAI.CO.ZA

QUANTUMBERRYAI.CO.ZA

AT A GLANCE

Most businesses buy five things from five vendors. **Nobody owns the seams.**

QuantumBerry AI is an applied AI engineering studio in Cape Town. We take a business as it already runs, find where applied AI produces a real return, and build and run the system that delivers it.

BUILD

Autonomous AI agents

The Hermes framework: asynchronous subagents that absorb administrative load across finance, inbox, calendar and reporting.

BUILD

AI-powered websites and interfaces

Operational systems that put live data in front of decision-makers, with role-based access enforced at the data layer.

ASSESS

AI audits

Evidence-led assessment producing a prioritised, costed roadmap, including an explicit list of what not to build.

PROTECT

AI cybersecurity

Threat assessment, penetration testing, hardening and continuous monitoring, scoped to the infrastructure it protects.

THE DIFFERENCE

Built as one system, not bought as five. The audit defines what the interface must do. The interface is the agent's front door. Agents inherit the same data and rules. Security is scoped across the whole stack. One team is accountable for all of it.

One studio. One system. **Audit, interface, agents, security, care.**

01 Audit

02 Interface

03 Agents

04 Security

05 Care

01 An engineering studio, not an agency

We build working systems for South African businesses. Not proofs of concept, not slide decks, and not software that makes the business reshape itself around it.

What we believe

- **Evidence before build.** No engagement opens with an assumption about your business. The audit comes first, and it is allowed to conclude that an idea is not worth building.
- **Acceleration, not just automation.** Automation removes a task. Acceleration changes what the business is capable of. We aim for the second.
- **Security is not a closing phase.** Row-level access control, hardened authentication and zero-trust principles are in place from the first commit, not bolted on at handover.
- **Skilled hours belong on skilled work.** If an experienced person spends their week on reporting, reconciliation and routing, that is an engineering problem.
- **You own what we build.** Intellectual property in every system, asset and piece of content transfers to you on full settlement. No lock-in to a platform we own.

How we are different

Most studios sell either strategy or hands. We do both, so the person who scopes the work is the person who architects it and the person who answers your email about it. Our delivery model favours AI-augmented engineering over conventional development cycles, and that compression is passed to the client as speed and as cost, not kept as margin.

Applied, not experimental

Everything we build has to survive contact with a real business.

One accountable team

You speak to the person who built it. No account layer in between.

POSITIONING

We are small by design and deep by necessity. A studio structure means a client speaks to the engineer, not to an account layer, and work is taken on against real capacity rather than sold first and resourced afterwards.

02 How we work

Five stages, each feeding the next. Nothing is torn up to add the stage that follows it, and every phase ends with a decision point, so commitment is incremental.

01 Audit Map it before you automate it	02 Interface The AI-powered web app layer	03 Agents Automation that acts: Hermes	04 Security Hardened, monitored, maintained	05 Care Retained, iterated, accountable
--	---	--	---	---

PHASE	FOCUS	OUTPUT
Phase One	Foundational AI Audit	A prioritised implementation roadmap: every opportunity scored for impact, effort and risk, with a defensible cost model attached.
Phase Two	Core AI Implementation	Operational interfaces, Hermes agent deployment and cybersecurity hardening, built against the approved roadmap.
Phase Three	Optimisation and Scale	Measured tuning, extension across sites or departments, documentation and knowledge transfer.

The engagement path, step by step

- 01 Introductory consultation**
A short, no-obligation discussion to understand your operation and see whether there is a fit.
- 02 Audit scoping and proposal**
We define the scope, duration and investment for the audit and confirm it in writing before anything begins.
- 03 Phase One execution**
The audit is completed and the roadmap presented with costings. You are free to stop here and take the roadmap with you.
- 04 Phased implementation**
Build proceeds against the approved roadmap, with a decision point at each stage rather than one all-or-nothing commitment.
- 05 Care and continuity**
Once live, systems move onto a care retainer or scoped support, so the investment keeps compounding instead of quietly decaying.

SERVICE LINE ONE

03 The Foundational AI Audit

Every engagement begins here. Before any commitment to build, we establish where applied AI will produce the clearest return, and equally where it will not.

What we examine

- **Data availability and quality.** What exists, where it lives, how clean it is, and whether it can be reached programmatically.
- **Integration points.** How existing systems talk to each other, and where they do not.
- **Workflow analysis.** Which steps consume disproportionate skilled hours relative to the judgement they need.
- **Decision latency.** The gap between an event and a decision on it, usually the most expensive number in the business.
- **Security posture.** Authentication, access control and exposure across connected assets.
- **Compliance readiness.** POPIA obligations attaching to the data in scope.

What you receive

A prioritised roadmap

Every opportunity scored for impact, effort and risk, sequenced so the earliest work funds and de-risks the later work.

A defensible cost model

Indicative investment attached to each item, so the roadmap can go to a board or budget process without translation.

An explicit "do not build" list

The items where applied AI will not return, and why. Often the most valuable page in the report.

A security and compliance summary

What is exposed today and what the remediation sequence looks like.

THE AUDIT STANDS ALONE

The roadmap is yours on delivery. You are under no obligation to implement it with us, and we would rather hand over an honest roadmap you take elsewhere than sell a build we cannot defend. Audits are custom-scoped, and investment is confirmed in writing before the work begins.

SERVICE LINE TWO

04 Hermes: automation that acts

Hermes is our autonomous agent framework, configured per business. It is the studio's flagship, and the clearest expression of acceleration rather than automation.

Hermes runs asynchronous subagents. Instead of working through a queue one task at a time, it monitors incoming information, prepares scheduled work, compiles reporting and routes communication concurrently. Configured properly, it absorbs the administrative load carried by experienced people and returns that time to the work only they can do.

What Hermes handles today

- **Financial administration.** Expense capture, categorisation, VAT treatment and tax-year summaries.
- **Invoicing and quoting.** Generation, numbering, dispatch and follow-up on what is unpaid.
- **Inbox operations.** Triage, labelling, drafting, and escalation of what truly needs a human.
- **Calendar and scheduling.** Coordination, preparation briefs and conflict resolution.
- **Documents and files.** Structured storage, naming discipline and retrieval across cloud drives.
- **Reporting.** Scheduled management reports from live data, not a monthly scramble.

Conversational and voice agents. Alongside back-office agents we build customer-facing agents, including WhatsApp agents for hospitality and service businesses, where the customer never leaves the channel they already use. Voice agents are an active development track.

Autonomy without control is a liability. So every agent ships with a contract.

Guardrails and control

Written specification

Exact field mappings, controlled vocabulary and explicit limits, not loose instructions.

Approval gates

Money, new recipients and destructive actions stay behind human confirmation.

Supervised run-in

Confirmation is removed gradually. Logging and anomaly alerts stay permanent.

SERVICE LINES THREE AND FOUR

05 Interfaces and cybersecurity

AI-powered websites and interfaces

Not a brochure site. The place your customers and your staff actually operate from, and the front door your agents work behind.

AI concierge

Answers in your voice, from your real services and terms.

Qualified capture

Sorts serious from speculative before it reaches a human.

Instant estimates

Rules-based quoting on the spot, inside limits you set.

Booking and scheduling

Into your calendar, with confirmation and reminders.

Internal operating views

Staff dashboards over the same live data.

Plain-English analytics

What changed and what to do, not another dashboard.

AI cybersecurity, not an afterthought

An agent with access to your inbox, calendar and invoicing holds a serious privilege. Security is engineered into every build, with a dedicated monitoring layer on top.

- **Least privilege by default.** Every agent touches only what its job requires.
- **Credentials scoped per integration.** Never pooled, never shared across clients.
- **Approval gates on consequence.** Anything money-related or ambiguous escalates to a human.
- **Continuous monitoring.** Dedicated scanning through our Aikido Security partnership.
- **Codebase and dependency audits.** Reviewed on a cycle, not left to accumulate risk.
- **POPIA-conscious data handling.** Built for South African compliance expectations.

THEN WE STAY

The stage most suppliers skip. Every engagement lands in a defined care tier with a written allocation, inclusions and turnaround, so the system keeps improving after launch.

06 Leadership and delivery

Chad Douglas, Founder and Chief Executive

Over a decade in technology, Microsoft and CompTIA certified, and a Certified Ethical Hacker, with director-level experience in AI automation and engineering. Chad leads audit, architecture and delivery on every engagement and stays the direct point of contact throughout. He works as both strategist and hands-on builder: the systems described in this document are ones he has personally architected and shipped.

Areas of focus: autonomous agent architecture and multi-agent orchestration; applied AI for business administration; secure system design and access control; AI-augmented delivery engineering.

Delivery partners

The studio runs a deliberately small core. Where an engagement calls for co-delivery or specialist tooling, it is structured under a named agreement rather than subcontracted informally, so a client always knows exactly who is touching their systems.

PARTNER	ROLE
STRATAAGENT Solutions	Co-delivery partner for joint platform builds, sharing build and reporting workload.
Aikido Security	Security tooling partner supporting AI cybersecurity delivery: continuous code, dependency and cloud posture scanning.

Programme access

QuantumBerry AI holds NVIDIA developer programme access, including the NVIDIA 6G Developer Program, which provides the AI Aerial platform, the Aerial Omniverse Digital Twin and Sionna, alongside early access to software releases. That access underpins the studio's simulation and physical-AI research direction.

PRINCIPLE

You own it

IP transfers on full settlement.

PRINCIPLE

Honest roadmaps

Including what not to build.

PRINCIPLE

Built to last

Retained care, written turnaround.

START A CONVERSATION

Let's map what your business **actually** does.

A short, no-obligation discussion is all it takes to see whether there is a fit and where the first real return sits.
